

Table Glide Maintenance for Wet Floor Housekeeping

Tools needed: Moly EP grease, Small paint brush or Tinner's brush.

When table bases are used on a non-carpeted floor application, where the floor is maintained by wet mopping, it is necessary to coat the threaded stems of the adjustable glides with a non-soluble grease to protect the glide stems from corrosion. We recommend using industrial grade Moly EP grease, applied with a small brush. Repeat application of grease to the glide stems every six months.
